18 [3]

29 SEQUENCE OF 51-125; 705-762; 784-850 AND 872-932 FROM N.A.

20 Bacchiler D., Agius E., Larrain J., Piccolo S., Nieters A.,

21 Bac Dinding modules in the chordin patterning protein.";

22 Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.

23 In EMBL DOSABLISTING factor. Key developmental protein that dorsalizes early vertebrate embryonic tissues by binding to ventralizing TGP-beta family bone morphogenetic proteins (BMPB)

23 In Submitted RoCATION: Secreted (By similarity).

24 SUBCELLULAR LOCATION: Secreted (By similarity).

25 In ALTERNATIVE PRODUCTS: 5 isoforms; 1 (shown here), 2, 3, 4 and 5;

26 In TISSUE SPECIFICITY: Expressed at the highest level in liver.

27 In SIMILARITY: BELONGS TO THE CHORDIN PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-LINKED (GLCNAC. . ) (POTENTIAL).

L. Science 28:1218-2195(2000).

L. FUNCTION: MAJOR FUNCTION MAY BE TO AID IN DIGESTION.

-! FUNCTION: MAJOR FUNCTION MAY BE TO AID IN THE LARVAL GUT.

-! TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN THE LARVAL GUT.

-! DEVELOPMENTAL STAGE: BEGAN TO APPEAR AT LATE EMBRYO STAGE AND CONTINUED TO INCREASE IN ABUNDANCE THROUGHOUT THE LARVAL STAGE.

THEY ARE NOT PRESENT IN PUPAE BUT REAPPEARED IN THE ADULT.

-! MISCELLANDROOS: THE SEQUENCE SHOWN IS THAT OF SER!.

-! SIMILARITY: BELONGS TO PEPPIDASE FAMILY SI.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2, 7

Sequence 11, Application US/08416950
Patent No. 578036
GENERAL INFORMATION:
APPLICANT: CHISARI, Francis V.
TITLE OF INVENTION: LYMPHOCYTE RESPONSES TO HEPATITIS B VIBUS
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend Khourie and Crew
STREET: One Market Plaza, Steuart Street Tower
CITY: San Francisco
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ,

                                                                                                                                                                                                  The specification describes a fish serine proteinase. The proteinases are useful as medicaments, for treating and preventing a disease in a human or an animal such as pain, acute inflammation, chronic chronic chronic chronic architis, inchains the medicaments, bursitis, osteoarthritis, inchails remarked arthritis, inchails erythematosus, phlebitis, tendinitis, rash, psoriaais, acne, eczema, facial seborrheic eczema of the hands, face or neck, foreskin infections, athlete's foot, fistulae infections, infected topical ulcers, navel infections in newborns, wrinkles, scars, felicions, wounds from burns, fungal infections and immunological and antecimmune diseases. They are also useful for removing dead or peeling skin from otherwise healthy skin, and for treating or preventing a classes in which pathogenesis is caused by bacteria, virus, fungus, parasite or a protozoan or a receptor mediated binding is involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The specification describes a fish serine proteinase. The proteinases are useful as medicaments, for treating and preventing a disease in a human or an animal such as pain, acute inflammation, chronic chronic chronic chronic chronic architis, inflamed joints, bursitis, osteoarthritis, inflamed joints, bursitis, osteoarthritis, cheumatoid arthritis, septic arthritis, resh, cheumatoid arthritis, septic arthritis, rash, cheumatoid arthritis, septic arthritis, rash, cheumatoid arthritis, septic arthritis, rash, chected activates, acceme of the hands, face or neck, foreskin infections, athlete's foot, fistulae infections, infected topical ulcers, navel infections in newborns, wrinkles, scars, infections, wounds from burns, ling infections and immunological and autoimmune diseases. They are also useful for removing dead or peeling stin from otherwise healthy skin, and for treating or preventing a disease in which pathogenesis is caused by bacteria, virus, fungus, parasite or a protozoan or a receptor mediated binding is involved. The present sequence represents the amino terminal of bovine trypsin B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                     AAM02588 is the N-terminal portion of a factor derived from pig pancreatic tissue. The factor was designated PX. PX inhibits the action of otecoclasts and stimulates the action of otecoblasts, hence PX inhibits bone resorption and stimulates bone formation. The new factor also stimulates the proliferation of human MG-63 osteobastcoma calls (osteoblast-like cells). The factor is useful for treating bone loss, e.g. due to osteoporosis or Paget's disease. The factor may also be used to hasten bone fracture repair. Antibodies and antagonists of PX can be used to treat osteopetrosis and
                                                                                                                                                                                                                                                                                                      Gaps
           increatic-derived factor - which inhibits bone increases bone formation, used to develop prods. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The genetically engineered prod. can eliminate the dependency on human pancreas supplies for the elastase, and avoids antibody formation and possibility of anaphylaxis using porcine elastase.
                                                                                                                                                                                                                                                                                                    ;

The present sequence is bovine chymotrypsinogen. It was included in a review of sequence homologies of several plasminogen activators. Plasminogen is the principal serine protease zymogen in the practical interpretates. Its active form, plasmin, is implicated in pericellular proteelysis associated with a wide range of physiological and pathological protecesses. Plasminogen expression is regulated by plasminogen activators which hydrolyse a peptide bond in the plasminogen to convert it to plasmino or form tight binding complexes with plasminogen to spontaneously convert it to plasmin. The sequence plasminogen to spontaneously convert it to plasmin or form tight bunding through analysis has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful when inserted the propriet of plasminogen activation free plasminogen activation/recognition site of plasminogen benden as the properties are useful in preparing thrombolytic agents for treating the plasminogen activation free plasminogen benders such as heart attack.

This invention describes a novel method for treating ache and eczema using a krill-derived multifunctional enzyme [1] which comprises 2 or more of the activities of chymotrypsin, trypsin, collagenase, elastase or exopeptidase and is reactive with cell surface receptors such as proteins or glycoproteins. The product of the invention have antisebornheic, anti-ache, dermatological and anti-eczema activity.

[1] removes or inactivates cell surface receptors (proteins and glycoproteins) and adhesion molecules such as ICAM-1 (i.e. CD54), ICAM-2, VCAM-1, CD3, CD28, CD29, CD31, CD44, CD49, CD51, CD102 and the asialo GMI ceramide. This sequence represents the N-terminal fragment of bovine chymotrypsin which is used to describe the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transplantation rejection; hydrolase; graft versus host disease; cell surface adhesion molecule; immune reaction; inflammation; shock; tumour metastasis; autoimmune disease; Krill derived multifunctional enzyme.
                                                                                                                                                                    Treating acne and eczema using a krill-derived multifunctional enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preventing or ameliorating transplantation rejection reactions using hydrolase enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 82, DB 20; Length 20

                         The specification describes a method for preventing or ameliorating transplantation rejection reactions for transplantation of immune cells or other tissues. The method comprises treating a source of immune cells or with a hydrolase or hydrolase mixture and administering the treated immune cells to a recipient aimal. The hydrolase especially has a preference for temoving, destroying, inactivating or disabling at least cone of CD4, CD8, CD25, CD29, ICAN-1, CD55, an integrin, CD154, CD and CD80 in contrast to removing, destroying, inactivating or disabling TGR. The methods are useful for preventing graft versus host concuses which are involved in triggering the immune reactions involved in the disease by using hydrolase enzymes to remove the cell surface adhesion cell-cell or cell-virus adhesion syndrome comprisaing inflammation, shock, twocur metastases, autoimmune disease, transplantation rejection contrainal of a hydrolase, which may be used in the method of the
                                                                                                                                                                                                                                                                                                                                                               o'

The present invention relates to a method for ameliorating transplantation rejection reaction. The method comprises treating extra-corporally donor tissue or donor source of immune cells with a rejection ameliorating effective amount of a hydrolase enzyme. The method is useful for ameliorating, treating or preventing immune rejection reactions such as graft versus host diseases, organ or tissue transplantation rejection, autoimmune disease and associated conditions, obstructive pulmonary disease (COPP), atheroscierosis, chronic obstructive pulmonary disease (COPP), atheroscierosis, cancer, asthma, septic shock, toxic shock syndrome, conjunctivitis, reperfusion injury of bovine serine multifunctional hydrolase, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   proteins, called pancreatic cancer antigens, given in AAB54068 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, pancreas; pancreatic cancer; pancreatic cancer antigen; detection; diagnosis; identification; cytostatic; neuroprotective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinfiammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative.

preventing, treaturing, transcribing in minutary.

for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to design nucleic Agonists and antagonists to the antigens can be used to design nucleic pancreatic cancer antigen polynucleotides can be used to design nucleic can hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate minutely proteins can be used to protein cand in vitro diagnostic and therapeutic methods. The proteins can gastrointestinal pulmonary, cardiovascular, renal or proteins can gastrointestinal pulmonary, cardiovascular, represent proliferative disorders. AAC99222 to AAC99240 and AAB54467 represent sequences used in the exemplification of the present invention. or ameliorating a medical condition or in assays

The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH33601 and AAB98500).
TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for at risk of getting an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15. Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, Example 10; Fig 1; 130pp; English. ovarian cancer

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory disorders inflammatory disorders

Claim 6; Fig 2M; 313pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (c.g. inflammatory diseases and atchma), cardiovascular diseases and disorders (e.g. inflammatory diseases and atchma), cardiovascular diseases and disorders (e.g. the invental associated (e.g. restenosis and coronary thrombosis), brain or neuronal associated disearces (e.g. rheumatoid arthritis and psoriasis), central or corribberal nervous system diseases, migraines, pain, sexual dysfunction, peripheral nervous system diseases, migraines, pain, sexual dysfunction, psychotic disorders, cognition disorders, hypotension, hypotension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, Parkinson's disease) and dyskinesias.

The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular characters.

The invention relates to novel serine proteases designated BSSP5 (AAB11710-B11711), and to nucleic acids encoding them (AAA61733-A61734). The invention also relates to vectors and transformants comprising BSSP5 mucleic acids; transgenic animals in which the expression level of BSSP5 can be varied; and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such antibodies, methods of BSSP5 detection using the antibodies, and the nucle of BSSP5 proteins or fragments as diagnostic markers for certain pancial conditions, e.g., pancreatitis. A method for detecting pancreatitis comprising messuring BSSP5 concentration in the blood or utine, and a pancreatitis diagnostic agent containing an anti-BSSP5 antibody is also disclosed. Nucleotides encoding BSSP5 were initially isolated in a human brain cDNA library using degenerate pCR primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (AAAA1744.A61745) based on conserved regions of serime proceases. The BSSP5 serime proceases and nucleotides encoding them are useful in detecting homologues, mutents and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland, placenta, testis, pancreas and spleen) as diagnostic markers for conditions such as Alzheimer's disease, epilepsy, cancer, inflammation, infertility, pancreatitis and prostatic hypertrophy. Sequence AABI1110 represents human BSSP5 (hBSSP5), and sequence AABI1711 represents murine BSSP5
BSSP5; serine protease; human; hBSSP5; mouse; mBSSP5; brain; diagnostic marker; antibody; transgenic animal; Alzheimer's disease; epilepsy; cancer; inflammation; infertility; pancreatitis; prostatic hypertrophy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Serine proteases BSSP5, useful in detecting homologs, mutants and polymorphic variants as markers for diagnosis of e.g. Alzheimer's disease, epilepsy, cancer and inflammation, using blood, urine, pancreas or other tissues

Sequence encoding pancreas elastase may be used to transform an expression system. The product is useful in rejuvenating the elasticity of the arterial wall, and improving unusual serum lipid levels and lipoprotein metabolism.
                                                                                                                                                                                                                                                                                       Pancreas elastase prodn. used to improve lipoprotein metabolism -
comprises isolating RNA coding elastase, synthesising single and
double chain cDNA and introducing recombinant into host

Chymotrypsin (EC 3.4.21.1) B precursor - bovine
N'Alternate names: chymotrypsinogen B
N'Alternate names: chymotrypsinogen B
N'Alternate names: chymotrypsinogen B
C'Species: Bos primigenius taurus (cattle)
C'Bate: 08-0ct-1981 #sequence_revision 08-0ct-1981 #text_change 18-Jul-1997
C'Accession: A00953
R'Smillie, L.B.; Furka, A.; Nagabhushan, N.; Stevenson, K.J.; Parkes, C.O.
Nature 218, 343-346, 1968
A;Ttle: Structure of chymotrypsinogen B compared with chymotrypsinogen A and trypsinogen
A;Reference number: A00953; MUD:68238908; PMID:5649671
A;Molecule type: protein
A;Molecule type: protein

A;Title: Localization and characterization of the glycosylation site of human pancreatid
A;Reference number: S04490; MUID:89289996; PMID:2737288
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chymotrypsin (EC 3.4.21.1) - Atlantic cod (fragments)

Cispecies Gadus morthua (Atlantic cod)

Cispecies: 15-0ct-1994 #sequence_revision 15-0ct-1994 #text_change 11-May-2000

CiAccession: A61229

                                                                                                                                                                             "Caldecrin is a novel-type serine protease expressed in pancreas, but its homologue, elastase IV, is an artifact during cloning derived from caldecrin gene."

J. Biochem. 123:546-554 (1998).

-i- FUNCTION: HAS CHYMOTRYPSIN-TYPE PROTEASE ACTIVITY AND HYPOCALCEMIC.
                                                                                                                                                                                                                                                      -:-CATALYTIC ACTIVITY: Preferential cleavage: Leu-|-Xaa, Tyr-|-Xaa, Phe-|-Xaa, Met-|-Xaa, Trp-|-Xaa, Gln-|-Xaa, Asn-|-Xaa, Tyr-|-Xaa, Tissue Specificity: PANCREAS.
-:-SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. ELASTASE SUBFAMILY.
-:- CAUTION: WAS ORIGINALLY (REF.2) THOUGHT TO BE ELASTASE IV.
